

# Real v. Not

- Notation RULES shaped by:
  - Reality (observed RULES)
  - Contrivance (artificial or invented “rules”)
- Math notation RULES are observed
- Observation RULES → math useful
- Math RULES are not:
  - Invented → You could make this stuff up, but ...
  - Artificial → To what purpose?
  - Contrived → The results would be disastrous!

# RULES: Good, Bad, Ugly

- **if** [language] = contrived **then** [result]
- Where:
  - Good = Based on observed rules of reality
  - Bad = Somewhat good
  - Ugly = Utterly invented or made up
- Results?
  - Good: Elegant, highly useful, LESS bugs!
  - Bad/Ugly: Difficult, questionably useful, BUGS!

# All languages “Create”

- How?
  - By special “Creation Procedures”
  - In Java = “Constructors”
- What are they?
  - “Creation instructions” → makes object & set fields
  - Language notation to ID “creation instructions”

# PANCAKE Creation RULES

- Q: How does one make pancakes?
  - A: Recipe (written or remembered)
- Q: Is there only one recipe for pancakes?
  - A: NO! There are many!
- Q: If we make “Class PANCAKE” and the constructors are “recipes”, do we expect many creation procedures?
  - A: YES, WE DO!

THEN: Why does Java have only ONE?

# Java Constructor “rules”

- Constructor name MUST = Class name (why?)
- Dif constructors = same name/dif args (why?)\*
- “super” must be in first line (why?)\*
- Many other irrational “rules”!
- Java is NOT the only one!

*\* NO logical or rational reason!*

# PANCAKE CLASS

- NOTE:
  - One class: PANCAKE
  - Many recipes (creations)
  - Constrained access:
    - HOME\_BREW
    - CHEFS

```
1 class
2   PANCAKE
3
4   create {HOME_BREW}
5     make_deairas_method,
6     make_brads_method,
7     make_bradleys_method,
8     make_michaels_method,
9     make_larrys_method
10
11   create {CHEFS}
12     make_alton_brown_method,
13     make_gordon_ramsey
14
15   feature {NONE} -- Initialization
16
17     make_deairas_method do end
18     make_brads_method do end
19     make_bradleys_method do end
20     make_michaels_method do end
21     make_larrys_method do end
22     make_alton_brown_method do end
23     make_gordon_ramsey do end
```

# Consequences: Java

- Multiple “constructors” / same name
  - Severe lack of semantics
  - Small semantics → Big Confusion → Big Bugs

What if the only thing you see is this code?

How can you tell the difference (semantically) between them?

Answer: You cannot! You MUST look at the implementation of each “form” of “constructor” to know because only the actual implementation code reveals the purpose of each form of “constructor”.

```
public class Platypus {  
    String name; Property or feature being affected  
    Platypus(String input) {  
        name = input;  
    }  
    Platypus() {  
        this("John/Mary Doe");  
    }  
    public static void main(String args[]) {  
        Platypus p1 = new Platypus("digger");  
        Platypus p2 = new Platypus();  
    }  
}
```

Creation calls #1 (w/"String") and #2 (w/o args)

Constructors

- “Platypus” alone tells no story about creation!!!
- Okay, I pass a String; so what? That means what?

## Real v. Not

- Notation RULES shaped by:
  - Reality (observed RULES)
  - Contrivance (artificial or invented “rules”)
- Math notation RULES are observed
- Observation RULES → math useful
- Math RULES are not:
